

## 8 Digit Water Powered Calculator

### **Operation Manual**

*Please read this operation manual before use:*

1. To activate the calculator, remove the H<sub>2</sub>O Water powered battery from the rear of the calculator.

2. Unscrew the clear cap by turning anti-clockwise and fill with a few drops of water to about  $\frac{3}{4}$  full. Screw the battery body back on to the cap. Do not over tighten.
3. Ensure the battery is dry before replacing – else corrosion may occur.
4. Replace the battery, ensuring that the polarity lug is on top. The battery should only fit in one way. Please make sure that the ribbon is placed under the battery to ensure easy removal next time.

5. Press the **ON/AC** key, the LCD shows 0, and your calculator is working.

***When the display begins to fade, please add more water to the battery. The water-powered battery is guaranteed for 1 year but will often run continuously for up to 2 years.***
